

Abstract of the Disclosure

A method for rerouting mailpieces in a carrier distribution system includes the steps of receiving a plurality of mailpieces within the carrier distribution system; dynamically determining criteria defining a suspect group of mailpieces; automatically detecting the presence of the plurality of mailpieces within the carrier distribution system; identifying suspect mailpieces from the plurality of mailpieces by automatically detecting within the carrier distribution system which of the plurality of mailpieces meet the criteria defining the suspect group of mailpieces; and outsorting the suspect mailpieces for evaluation. A postal distribution system incorporates the method.
